Data Import :: CHEAT SHEET

R's tidvverse is built around tidv data stored in **tibbles**, which are enhanced data frames.

The front side of this sheet shows how to read text files into R with readr.

The reverse side shows how to create tibbles with tibble and to layout tidy data with tidyr.

OTHER TYPES OF DATA

Try one of the following packages to import other types of files

- haven SPSS, Stata, and SAS files
- readxl excel files (.xls and .xlsx)
- **DBI** databases
- **isonlite** ison
- xml2 XML
- httr Web APIs
- rvest HTML (Web Scraping)

Save Data

Save x, an R object, to path, a file path, as:

Comma delimited file

write csv(x, path, na = "NA", append = FALSE. col names = !append)

File with arbitrary delimiter

write_delim(x, path, delim = " ", na = "NA", append = FALSE, col_names = !append)

CSV for excel

write excel csv(x, path, na = "NA", append = FALSE, col names = !append)

String to file

write_file(x, path, append = FALSE)

String vector to file, one element per line

write_lines(x,path, na = "NA", append = FALSE)

Object to RDS file

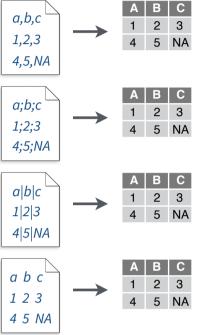

write_rds(x, path, compress = c("none", "gz", "bz2", "xz"), ...**)**

Tab delimited files

write_tsv(x, path, na = "NA", append = FALSE, col_names = !append)

Read Tabular Data - These functions share the common arguments:

read *(file, col names = TRUE, col types = NULL, locale = default locale(), na = c("", "NA"), quoted_na = TRUE, comment = "", trim_ws = TRUE, skip = 0, n_max = Inf, guess_max = min(1000, n max), progress = interactive())

Comma Delimited Files

read csv("file.csv")

To make file.csv run: write file(x = "a,b,c $\n1,2,3\n4,5,NA$ ", path = "file.csv")

Semi-colon Delimited Files

read_csv2("file2.csv")

write $file(x = "a;b;c\n1;2;3\n4;5;NA", path = "file2.csv")$

Files with Any Delimiter

read_delim("file.txt", delim = "|") write file(x = $\frac{|a|b|c}{12|3}n4|5|NA"$, path = $\frac{|a|b|c}{12|3}n4|5|NA"$, path = $\frac{|a|b|c}{12|3}n4|5|NA"$

Fixed Width Files

read_fwf("file.fwf", col positions = c(1, 3, 5)) write file(x = "a b c1 2 3\n4 5 NA", path = "file.fwf")

Tab Delimited Files

read tsv("file.tsv") Also read table().

write $file(x = "a\tb\tc\n1\t2\t3\n4\t5\tNA", path = "file.tsv")$

USEFUL ARGUMENTS

1 2 3

4 5 NA

Example file

write file("a,b,c\n1,2,3\n4,5,NA","file.csv") f <- "file.csv"

Α	В	С	No header
1	2	3	read_csv(f, col_names = FALSE)
4	5	NA	read_csv(i, cot_names = i ALSL)
Х	у	z	Provide header

read csv(f, skip = 1)

Skip lines

Read in a subset

read csv(f, \mathbf{n} max = 1)

Provide header read_csv(f, col_names = c("x", "y", "z"))

Missing Values

Read Non-Tabular Data

Read a file into a single string

read file(file, locale = default locale())

Read each line into its own string

read_lines(file, skip = 0, n_max = -1L, na = character(), locale = default_locale(), progress = interactive())

Read a file into a raw vector

read file raw(file)

Read each line into a raw vector

read_lines_raw(file, skip = 0, n_max = -1L, progress = interactive())

Read Apache style log files

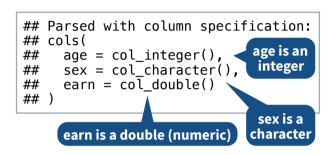

read log(file, col names = FALSE, col types = NULL, skip = 0, n max = -1, progress = interactive())

Data types

readr functions guess the types of each column and convert types when appropriate (but will NOT convert strings to factors automatically).

readr

A message shows the type of each column in the result.

1. Use **problems()** to diagnose problems.

x <- read_csv("file.csv"); problems(x)

- 2. Use a col_function to guide parsing.
 - col_guess() the default
 - col_character()
- col_double(), col_euro_double()
- col datetime(format = "") Also col date(format = ""), col time(format = "")
- col_factor(levels, ordered = FALSE)
- col_integer()
- col_logical()
- col number(), col numeric()
- col skip()

x <- read csv("file.csv", col types = cols($A = col_double(),$ $B = col_logical(),$ **C** = **col_factor()))**

- 3. Else, read in as character vectors then parse with a parse_function.
 - parse_guess()
- parse character()
- parse_datetime() Also parse_date() and parse_time()
- parse_double()
- parse_factor()
- parse integer()
- parse_logical()
- parse number()
- x\$A <- parse_number(x\$A)

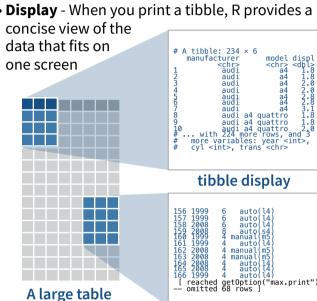

Tibbles - an enhanced data frame

The **tibble** package provides a new S3 class for storing tabular data, the tibble. Tibbles inherit the data frame class, but improve three behaviors:

- Subsetting [always returns a new tibble, [[and \$ always return a vector.
- No partial matching You must use full column names when subsetting

Display - When you print a tibble, R provides a

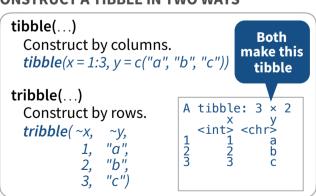

• Control the default appearance with options:

data frame display

- options(tibble.print_max = n, tibble.print_min = m, tibble.width = Inf)
- View full data set with View() or glimpse()
- Revert to data frame with as.data.frame()

CONSTRUCT A TIBBLE IN TWO WAYS

to display

as_tibble(x, ...) Convert data frame to tibble.

enframe(x, name = "name", value = "value") Convert named vector to a tibble

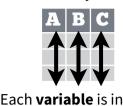

is tibble(x) Test whether x is a tibble.

Tidy Data with tidyr

Tidy data is a way to organize tabular data. It provides a consistent data structure across packages.

A table is tidy if:

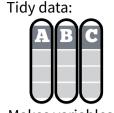

its own column

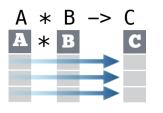

Each **observation**, or case, is in its own row

Makes variables easy to access as vectors

Preserves cases during vectorized operations

Reshape Data - change the layout of values in a table

Use **gather()** and **spread()** to reorganize the values of a table into a new layout.

gather(data, key, value, ..., na.rm = FALSE, convert = FALSE, factor key = FALSE)

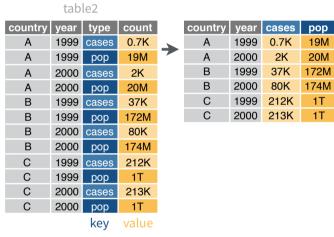

gather() moves column names into a key column, gathering the column values into a single value column.

ta	ble4a					
country	1999	2000		country	year	cases
Α	0.7K	2K	\rightarrow	Α	1999	0.7K
В	37K	80K		В	1999	37K
С	212K	213K		С	1999	212K
				Α	2000	2K
				В	2000	80K
				С	2000	213K
					key	value

gather(table4a, `1999`, `2000`, key = "year", value = "cases")

spread(data, key, value, fill = NA, convert = FALSE, drop = TRUE, sep = NULL)

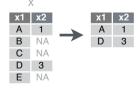

spread() moves the unique values of a **key** column into the column names, spreading the values of a value column across the new columns.

spread(table2, type, count)

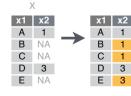

Handle Missing Values

drop_na(data, ...) Drop rows containing NA's in ... columns.

 $drop_na(x, x2)$

fill(data, ..., .direction = c("down", "up")) Fill in NA's in ... columns with most recent non-NA values.

fill(x, x2)

replace na(data, replace = list(), ...**)** Replace NA's by column.

 $replace_na(x, list(x2 = 2))$

Expand Tables - quickly create tables with combinations of values

complete(data, ..., fill = list())

values of the variables listed in ... complete(mtcars, cyl, gear, carb)

expand(data, ...)

Adds to the data missing combinations of the Create new tibble with all possible combinations of the values of the variables listed in ...

expand(mtcars, cyl, gear, carb)

Split Cells

Use these functions to split or combine cells into individual, isolated values.

separate(data, col, into, sep = "[^[:alnum:]] +", remove = TRUE, convert = FALSE, extra = "warn", fill = "warn", ...)

Separate each cell in a column to make several columns.

table3

country	year	rate		country	year	cases	рор
Α	1999	0.7K / 19M		Α	1999	0.7K	19M
Α	2000	2K/20M	-	Α	2000	2K	20M
В	1999	37K / 172M		В	1999	37K	172
В	2000	80K / 174M		В	2000	80K	174
С	1999	212K / 1T		С	1999	212K	1T
С	2000	213K / 1T		С	2000	213K	1T

separate(table3, rate, sep = "/", *into* = *c*("*cases*", "*pop*"))

separate_rows(data, ..., sep = "[^[:alnum:].] +", convert = FALSE)

Separate each cell in a column to make several rows. Also separate_rows_().

table3

country	year	rate		country	year	rate
Α	1999	0.7K / 19M		Α	1999	0.7K
Α	2000	2K/20M	\rightarrow	Α	1999	19M
В	1999	37K / 172M		Α	2000	2K
В	2000	80K / 174M		Α	2000	20M
С	1999	212K/1T		В	1999	37K
С	2000	213K / 1T		В	1999	172M
				В	2000	80K
				В	2000	174M
				С	1999	212K
				С	1999	1T
				С	2000	213K
				C	2000	1T

separate_rows(table3, rate)

.....

unite(data, col, ..., sep = " ", remove = TRUE)

Collapse cells across several columns to make a single column.

table5

country	century	year		country	year
Afghan	19	99		Afghan	1999
Afghan	20	00	—	Afghan	2000
Brazil	19	99		Brazil	1999
Brazil	20	00		Brazil	2000
China	19	99		China	1999
China	20	00		China	2000

unite(table5, century, year, col = "year", sep = "")
